References.....	24

Introduction

In our scenario, Supplier Data is in Snowflake, Customer Data is in Dataverse, and Employee Data is in SharePoint. All these data sources are updated at different times. To minimize the number of data refreshes of Dataflows, we are going to create individual Dataflows for Snowflake and SharePoint data sources.

Note: Multiple data sources are supported in a single Dataflow.

IT team has already established a link to Dataverse and applied the necessary data transformations, mirroring those in the Power BI Desktop file. They have ingested this data to Lakehouse in Admin workspace and have given us access to the table(s). We are going to create a Shortcut for the Lakehouse IT team has created.

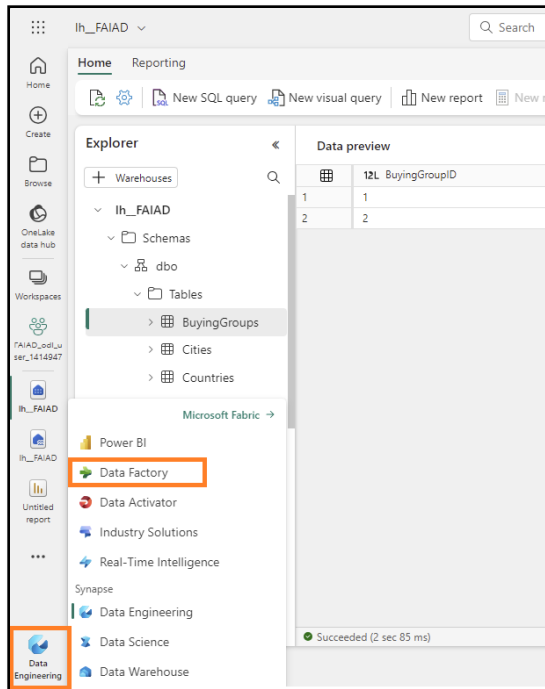

By the end of this lab, you will have learned:

- How to connect to SharePoint using Dataflow Gen2 and ingest data into Lakehouse
- How to connect to Snowflake using Dataflow Gen2 and ingest data into Lakehouse
- How to ingest data from a Shared Lakehouse

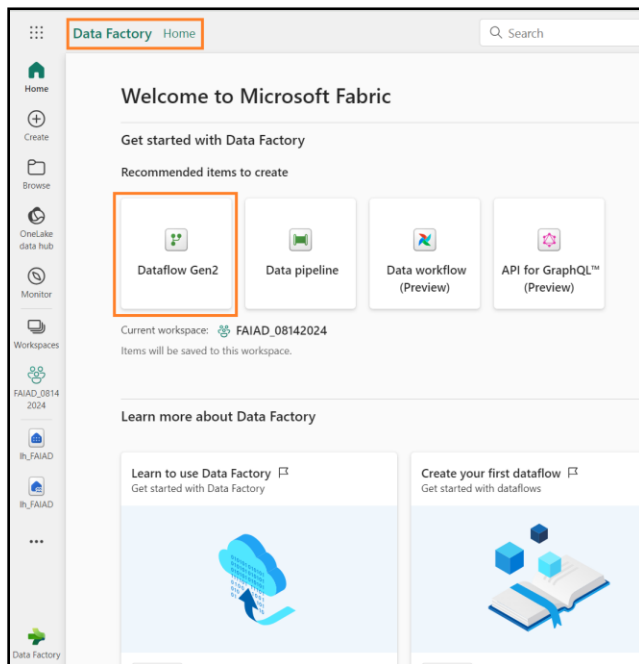

Dataflow Gen2

Task 1: Copy SharePoint queries to Dataflow

1. Let's navigate back to the Fabric workspace, **FAIAD_<username>** you created in Lab 2, Task 9.
2. Select **Fabric experience selector icon** on the bottom left of your screen. Fabric experience dialog opens
3. Select **Data Factory** from the dialog. You will navigate to **Data Factory Home page**.

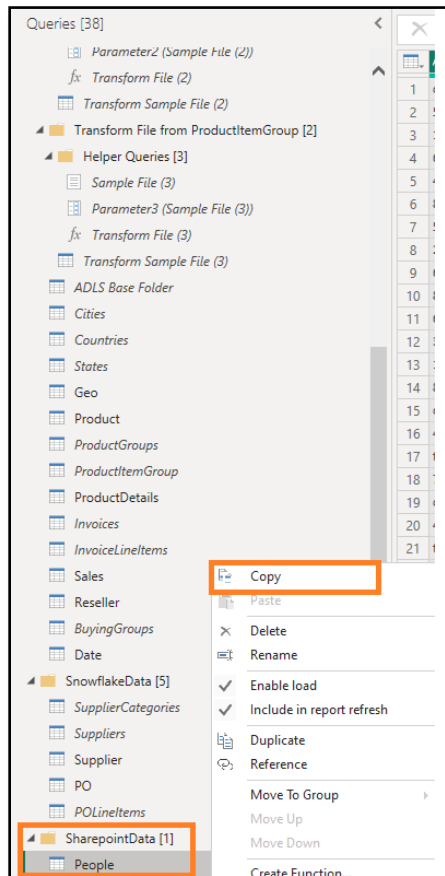

4. Under Recommended items, select **Dataflow Gen2**.

You will be navigated to the **Dataflow** page. Dataflow Gen2 interface is like Power Query in Power BI Desktop. We can copy queries from Power BI Desktop into Dataflow Gen2. Let's give this a try.

5. If you have not already opened it, open the **FAIAD.pbix** located in **Reports** folder on the desktop of your lab environment.

6. From the ribbon select **Home -> Transform data**. Power Query window opens. As you have noticed in the earlier lab, queries in the left panel are organized by data source.
7. From the left panel, under the SharepointData folder **select People** query.
8. **Right click** and select **Copy**.

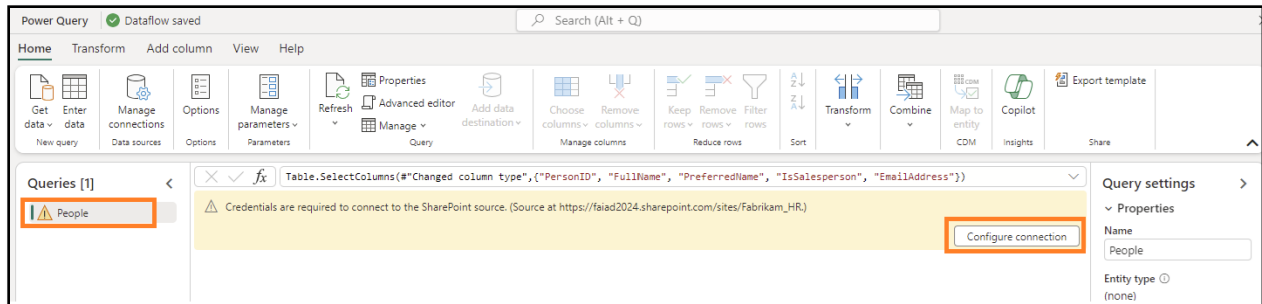

9. Navigate back to the **Dataflow screen** in the browser.
10. In the **Dataflow pane**, enter **Ctrl+V** (currently right click Paste is not supported). If you are using MAC device, please use Cmd+V to paste.

Note: If you are working in the lab environment, please select the ellipsis on the top right of the screen. Use the slider to **enable VM Native Clipboard**. Select OK in the dialog. Once done pasting the queries you can disable this option.

Notice the query pasted and is available in the left panel. Since we do not have a connection created to SharePoint, you will see a warning message requesting you to configure the connection.

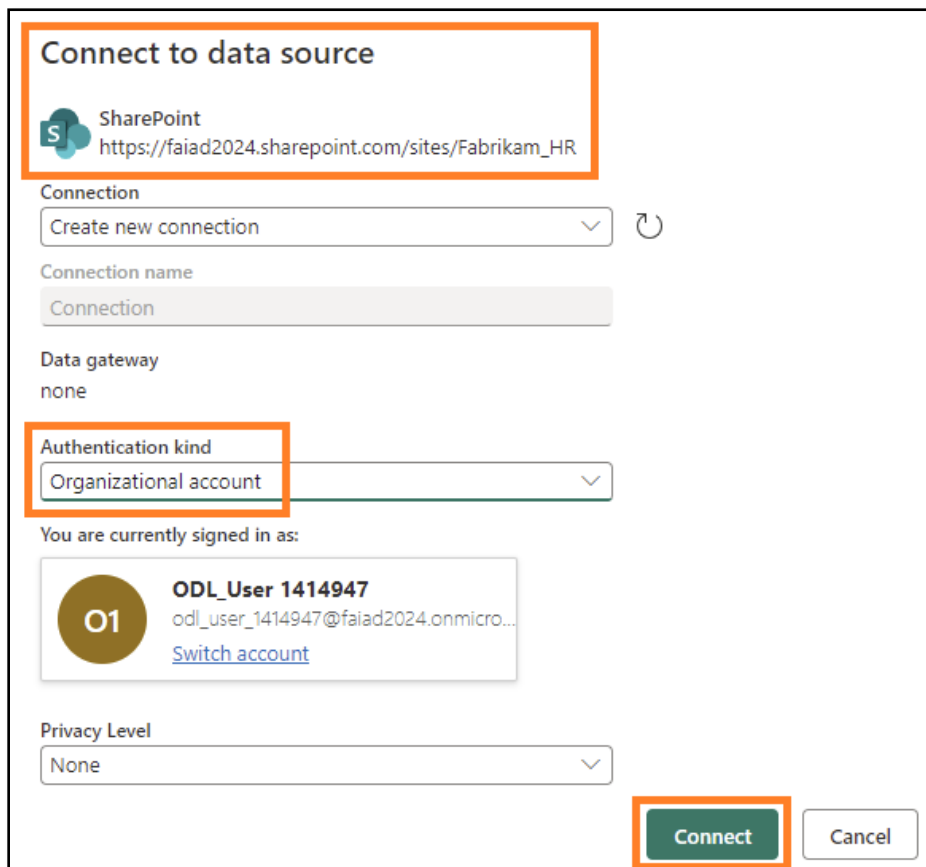

Task 2: Create SharePoint connection

1. Select **Configure connection**.

2. Connect to data source dialog opens. In the **Connection** dropdown make sure **Create new connection** is selected.
3. **Authentication kind** should be **Organizational Account**.
4. Select **Connect**.

Note: You will be signed in using your credentials. They will be different than the screenshot below.

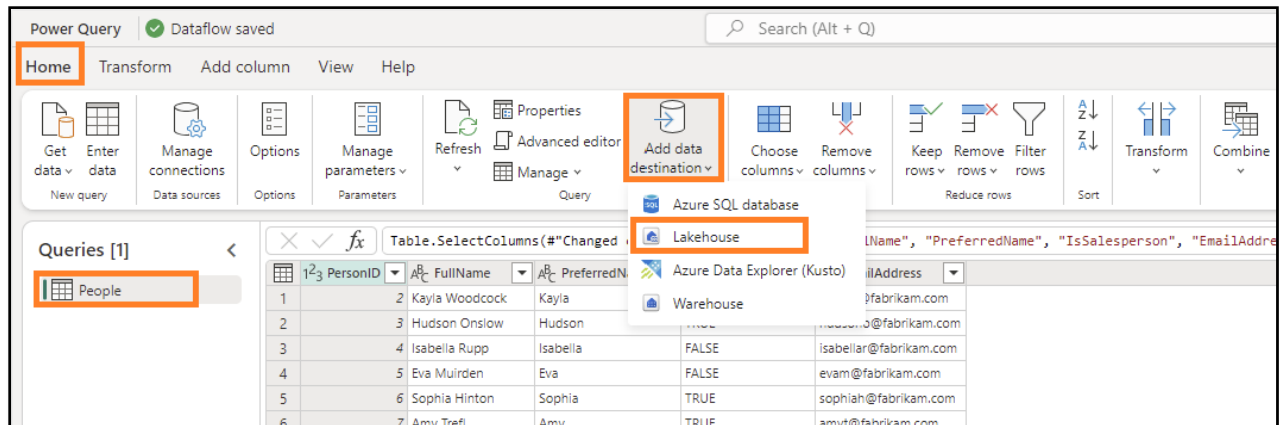

Task 3: Configure Data destination for People query

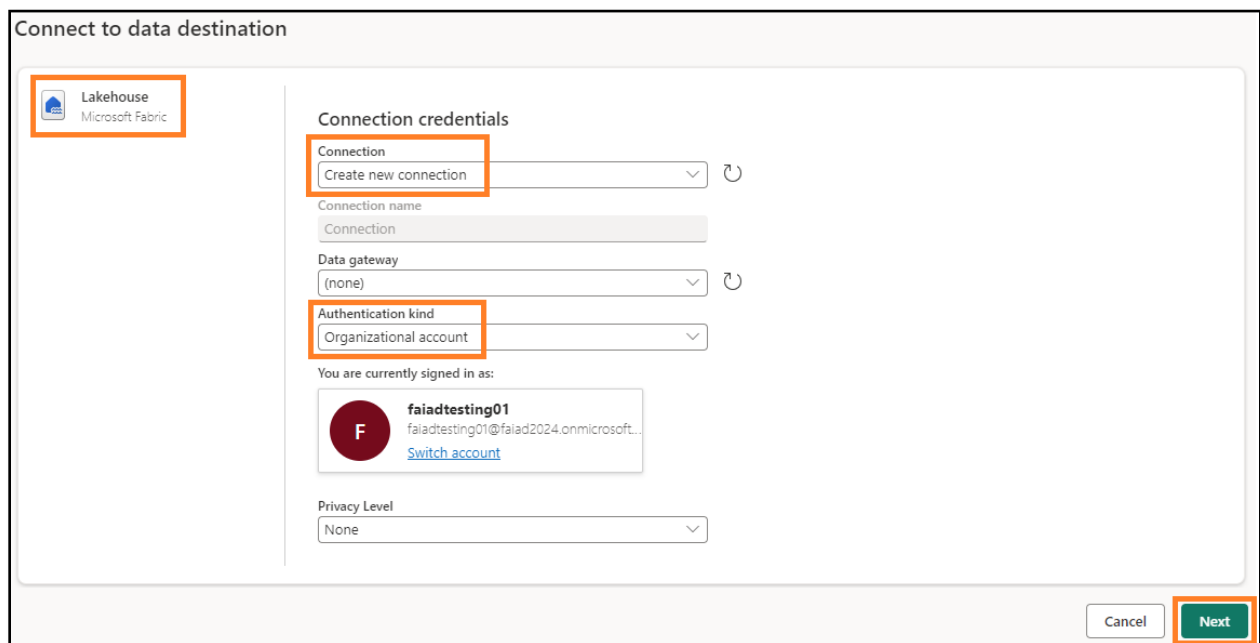

Connection is established and you can view the data in the preview panel. Feel free to navigate through the Applied Steps of the queries. Now we need to ingest People data into Lakehouse.

1. Select **People** query.

2. From the ribbon select **Home -> Add data destination -> Lakehouse**.

3. Connect to data destination dialog opens. We need to create a new Connection to the Lakehouse. With **Create new connection** selected in the **Connection dropdown** and **Authentication kind** set to **Organizational account**, select **Next**.

4. Choose destination target dialog opens. Make sure the **New table radio button** is selected, since we are creating a new table.
5. We want to create the table in the Lakehouse we created earlier. In the left panel, navigate to **Lakehouse -> FAIAD_<username>**.
6. Select **lh_FAIAD**
7. Leave the table name as **People**
8. Select **Next**.

Choose destination target

People

Back

Cancel

Next

9. Choose destination settings dialog opens. Make sure **“Use automatic settings”** is **enabled**.

Note: You can disable automatic settings and notice you have options to set Update method and Schema options. Once done exploring, make sure **“Use automatic settings”** is **enabled**.

10. Select **Save settings**.

Choose destination settings

Task 4: Publish and Rename SharePoint Dataflow

1. You will be navigated back to the **Power Query window**. Notice on the bottom **right corner**, Data destination is set to **Lakehouse**.
2. On the bottom right corner, select **Publish**.

Note: You will be navigated back to **FAIAD_<username> workspace**. It may take a few moments for the Dataflow to Publish.

3. Dataflow 1 is the dataflow we were working in. Let's rename it before we continue. Click on the **ellipsis (...)** next to Dataflow 1. Select **Properties**.

4. Dataflow properties dialog opens. Change the **name** to **df_People_SharePoint**
5. In the **Description** text box add **Dataflow to ingest People data from SharePoint to Lakehouse**.
6. Select **Save**.

The screenshot shows a dialog box titled "Dataflow 1" with a close button (X) in the top right corner. Below the title bar, there is a section labeled "* Required". Under this section, there are two fields: "Name" and "Description". The "Name" field contains the text "df_People_SharePoint". The "Description" field contains the text "Dataflow to ingest People data from SharePoint to Lakehouse". Below these fields, there is a line of text: "Last edited on 8/3/2024 at 10:00:17 PM by ODL_User 1414947". At the bottom right of the dialog box, there are two buttons: "Save" and "Cancel". The "Save" button is highlighted with an orange box.

You will be navigated back to **FAIAD_<username> workspace** .

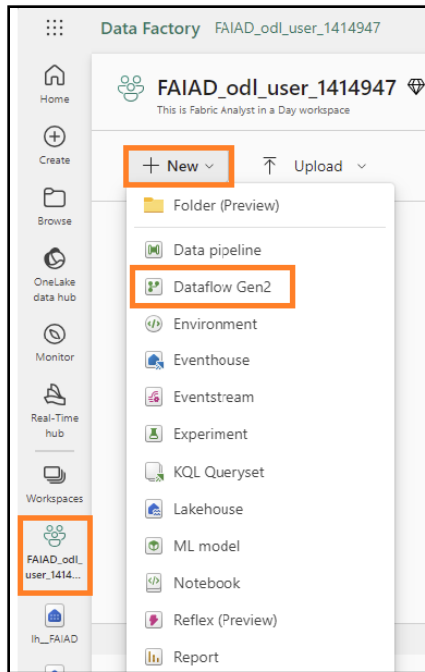

7. Select **lh_FAIAD** to navigate to the lakehouse.
8. Make sure you are in Lakehouse view (not SQL analytics endpoint).
9. Notice **People** table is now available in the Lakehouse.

Note: If you do not see the newly created tables, select the ellipsis next to Tables and select refresh to refresh the Tables.

We have now ingested all the data into Lakehouse. In the next lab, we will schedule Dataflow refresh.

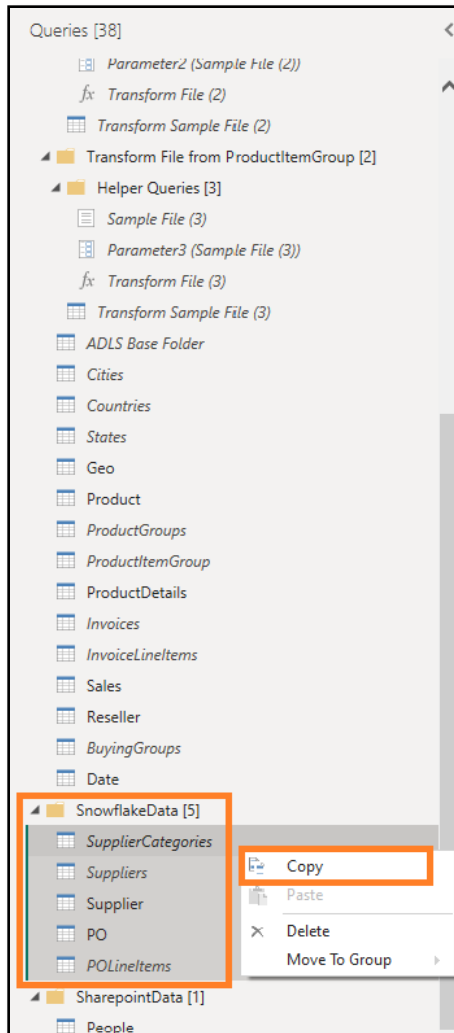

Task 5: Copy Snowflake queries to Dataflow

1. Let's navigate back to the Fabric workspace, **FAIAD_<username>**
2. From the top menu, select **New -> Dataflow Gen2**.

You will be navigated to the **Dataflow page**. Now that we are familiar with Dataflow, let's go ahead and copy the queries from Power BI Desktop into Dataflow.

3. If you have not already opened it, open the **FAIAD.pbix** located in **Reports** folder on the desktop of your lab environment.
4. From the ribbon select **Home -> Transform data**. Power Query window opens. As you have noticed in the earlier lab, queries in the left panel are organized by data source.
5. From the left panel, under the SnowflakeData folder **Ctrl+Select** or **Shift+Select** the following queries:
 - a. SupplierCategories
 - b. Suppliers
 - c. Supplier
 - d. PO
 - e. PO Line Items
6. **Right click** and select **Copy**.

7. Navigate back to the **browser**.
8. In the **Dataflow** pane select the **center pane**, enter **Ctrl+V** (currently right click Paste is not supported). If you are using MAC device, please use Cmd+V to paste.

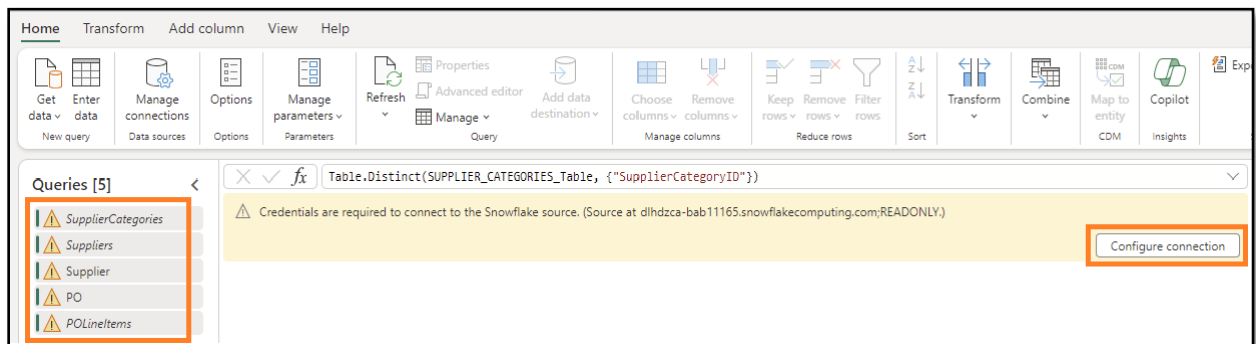

Note: If you are working in the lab environment, please select the ellipsis on the top right of the screen. Use the slider to **enable VM Native Clipboard**. Select OK in the dialog. Once done pasting the queries you can disable this option.

Task 6: Create connection to Snowflake

Notice the five queries are pasted and now you have the Queries panel on the left. Since we do not have a connection created for Snowflake, you will see a warning message requesting you to configure the connection.

1. Select **Configure connection**.

2. Connect to data source dialog opens. In the **Connection** dropdown make sure, **Create new connection** is selected.
3. **Authentication kind** should be **Snowflake**.
4. Enter the **Snowflake Username and Password** available in the Environment Variables tab (next to the Lab Guide tab).
5. Select **Connect**.

Connection is established and you can view the data in the preview panel. Feel free to navigate through the Applied Steps of the queries. Basically, Suppliers query has the details of suppliers and SupplierCategories as the name implies has supplier categories. These two tables are joined to create Supplier dimension, with the columns we need. Similarly, we have PO Line Items merged with PO to create the PO fact. Now we need to ingest the Supplier and PO data into Lakehouse.

Task 7: Configure Data Destination for Supplier and PO queries

1. Select the **Supplier** query.
2. From the ribbon select **Home -> Add data destination -> Lakehouse**.

Power Query | Dataflow saved | Search (Alt + Q)

Home Transform Add column View Help

1	A Datum Corporation	Novelty Goods Supplier
2	Contoso Ltd	Novelty Goods Supplier
3	Graphic Design Institute	Novelty Goods Supplier
4	Lucerne Publishing	Novelty Goods Supplier
5	Nod Publishers	Novelty Goods Supplier
6	Consolidated Messenger	Courier Services Supplier

3. Connect to data destination dialog opens. From the **Connection dropdown** select **Lakehouse (none)**.
4. Select **Next**.

5. Choose destination target dialog opens. Make sure the **New table radio button** is **selected**, since we are creating a new table.
6. We want to create the table in the Lakehouse we created earlier. In the left panel, navigate to **Lakehouse -> FAIAD_<username>**.
7. Select **lh_FAIAD**
8. Leave the table name as **Supplier**
9. Select **Next**.

10. Choose destination settings dialog opens. We will use the automatic settings as this will do a full update of the data. Also, it will rename the columns as needed. Select **Save settings**.

Choose destination settings

☒ Use automatic settings

Column mapping

Data destination

X Lakehouse

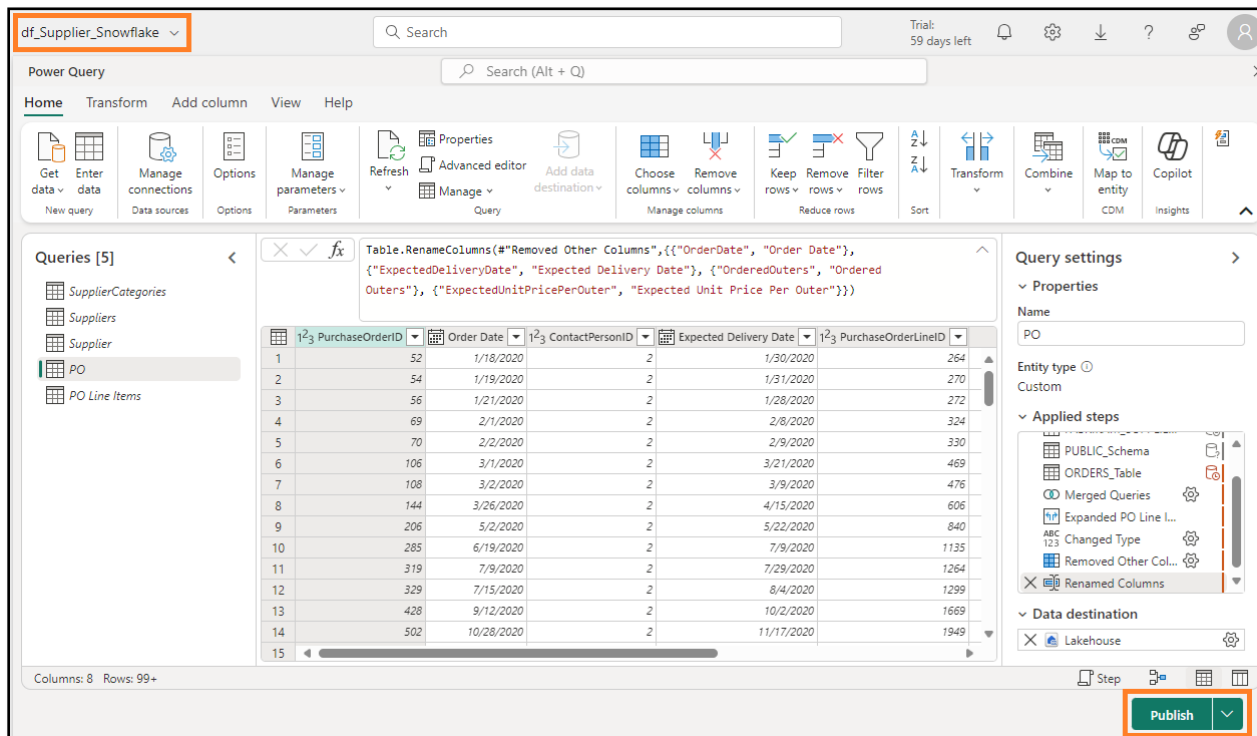

Step Publish

Task 8: Rename and Publish Snowflake Dataflow

- From the top of the screen, select the **arrow next to Dataflow 1** to rename.
- In the dialog, change the name to **df_Supplier_Snowflake**
- Click on **Enter** to save the name change.

4. On the bottom right corner, select **Publish**.

You will be navigated back to **FAIAD_<username> workspace**. It may take a few moments for the Dataflow to Publish.

5. Select **Ih_FAIAD** to navigate to the lakehouse.
6. Make sure you are in Lakehouse view (not SQL analytics endpoint).
7. Notice **PO** and **Supplier** table is now available in the Lakehouse.

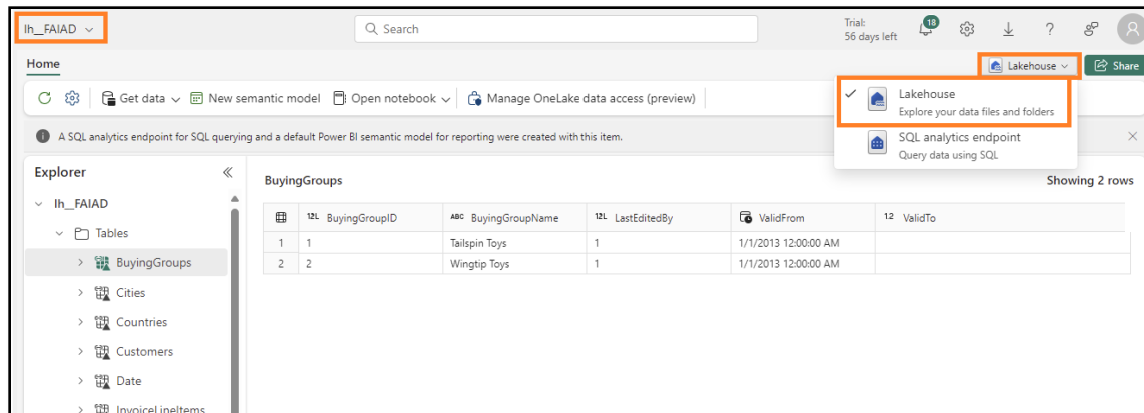

Note: If you do not see the newly created tables, select the ellipsis next to Tables and select refresh to refresh the Tables.

Now let's create a shortcut to bring in data from Dataverse.

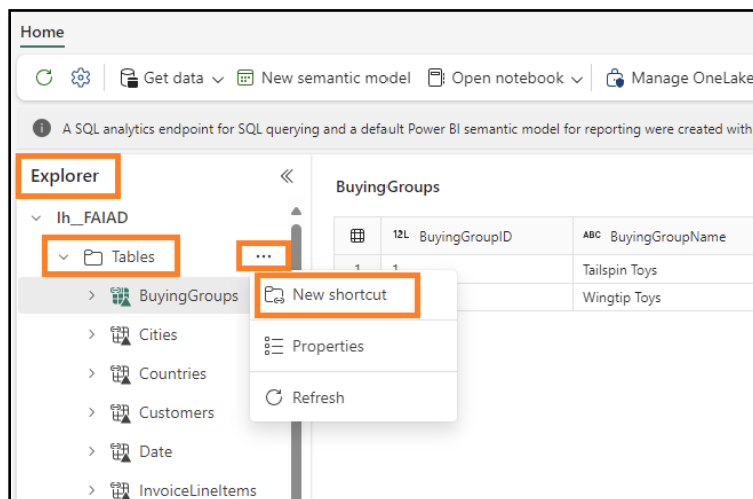

Shortcut to ADLS Gen2

Task 9: How to create a Shortcut to Dataverse

You should be in the Lakehouse **Ih_FAIAID**. Make sure you are in Lakehouse view (not SQL analytics endpoint).

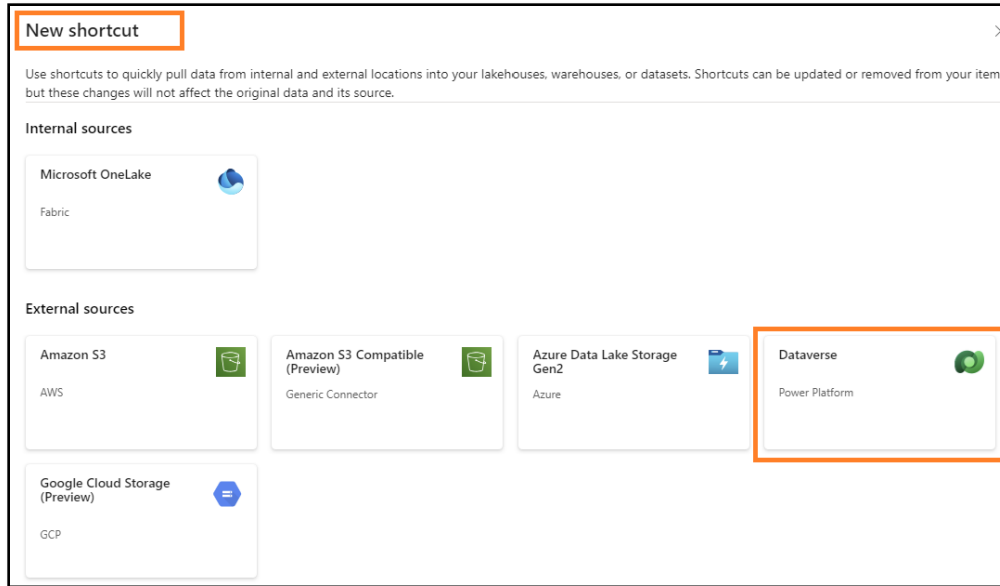

1. In **Explorer** panel, select the **ellipsis** next to **Tables**.
2. Select **New Shortcut**.

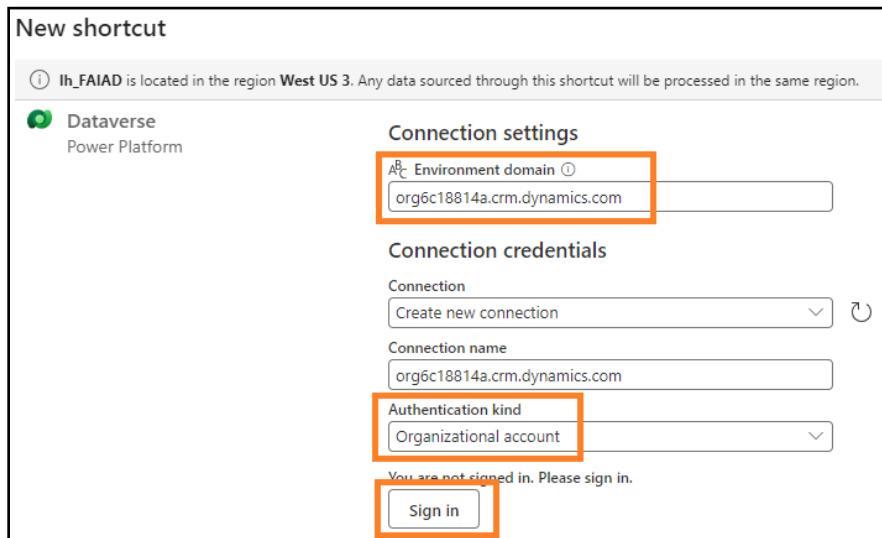

3. New shortcut dialog opens. Under **External sources**, select **Dataverse**.

Note: In the previous lab, we followed similar steps to create a shortcut to Azure Data Lake Storage Gen2.

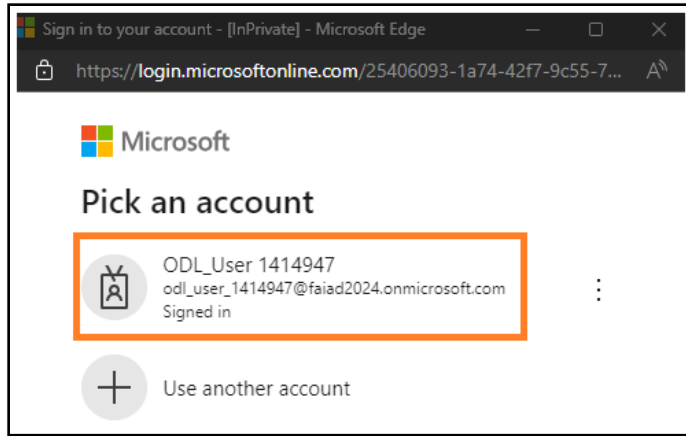

4. Connection settings dialog opens. Enter **org6c18814a.crm.dynamics.com** as **Environment domain**.
5. Leave **Authentication kind** as **Organizational account**.
6. Select **Sign in**.

7. Sign in to your account dialog opens. **Pick your account** to sign in.

Note: Your account will be different than the screenshot below.

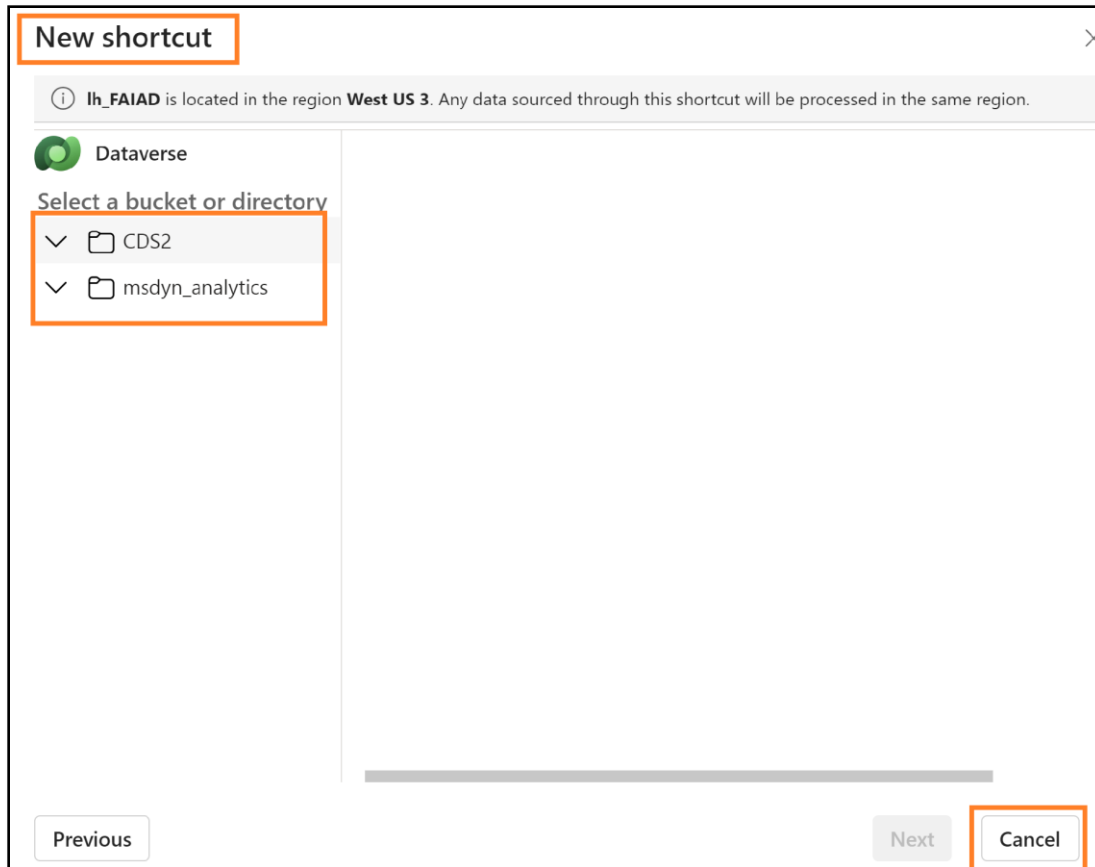

8. Select **Next** in Connection settings dialog.

You will be navigated to a dialog where you can pick the different bucket/directory from Dataverse. Notice there are a lot of different buckets available. We could pick the bucket(s) we need and follow the process like Lab 3 (use Visual query to transform data and create views). We could also use Dataflow Gen2 like we used earlier in this lab to connect to SharePoint. However, we do not have access to these bucket/directories.

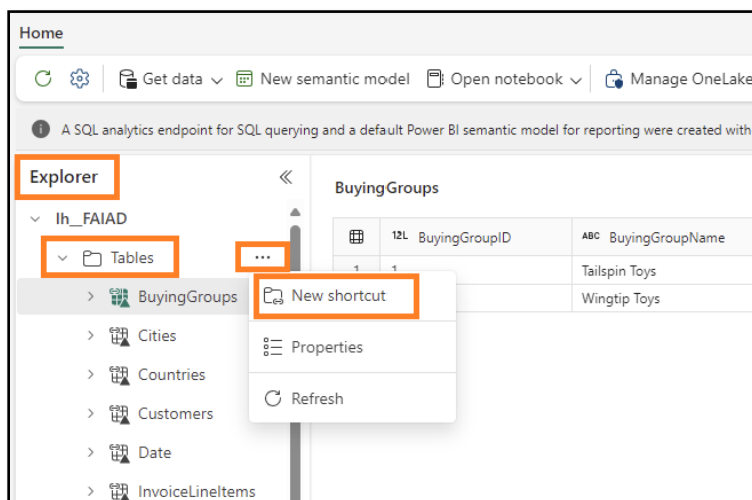

In our scenario, the IT team has already established a link to Dataverse and applied the necessary data transformations, mirroring those in the Power BI Desktop file. They have ingested this data to Lakehouse in Admin workspace and have given us access to the table(s). Since our IT team has done all the hard work, we can create a shortcut to this Lakehouse in Admin workspace.

9. Select **Cancel** in the New shortcut dialog to be navigated back to the Lakehouse.

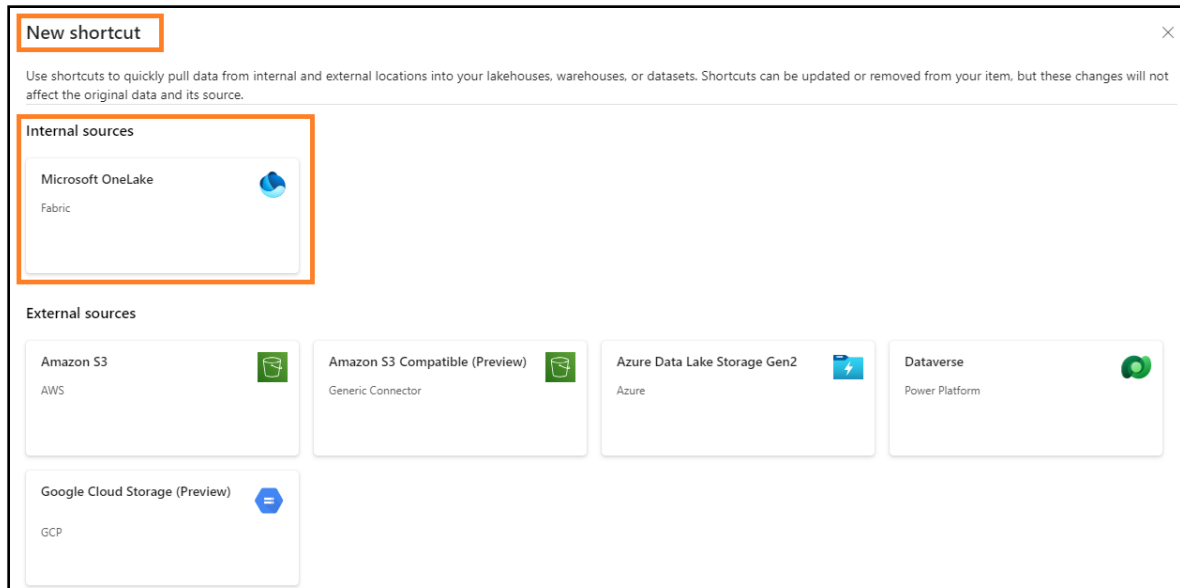

Task 6: Create a Shortcut to Lakehouse

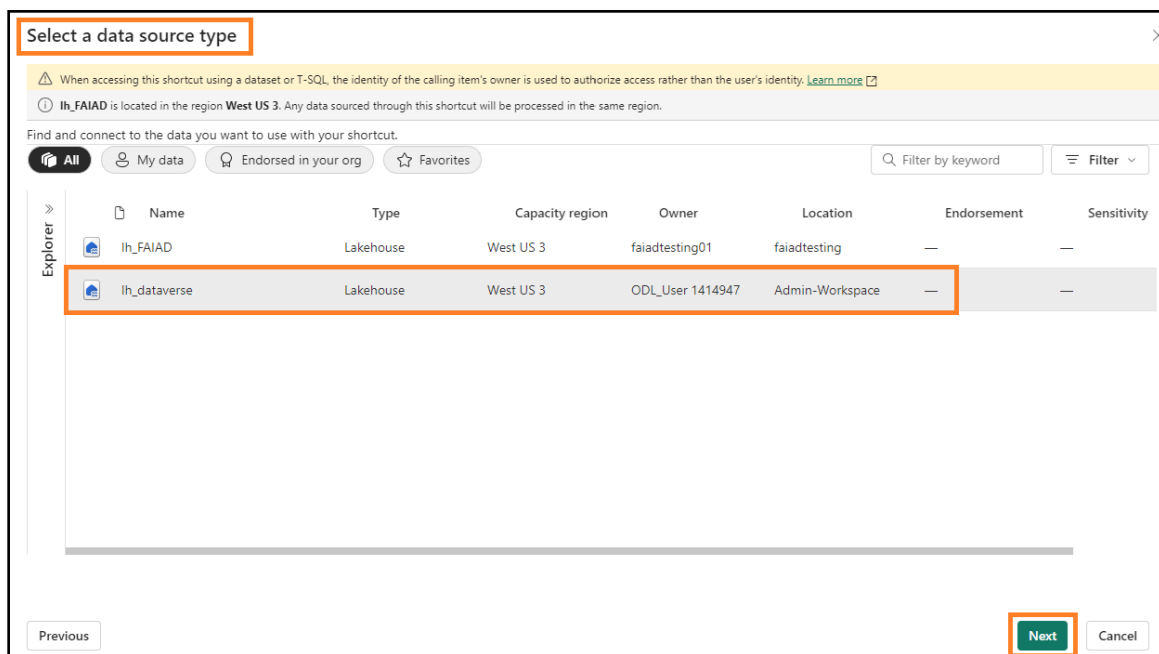

1. In **Explorer** panel, select the **ellipsis** next to **Tables**.
2. Select **New Shortcut**.

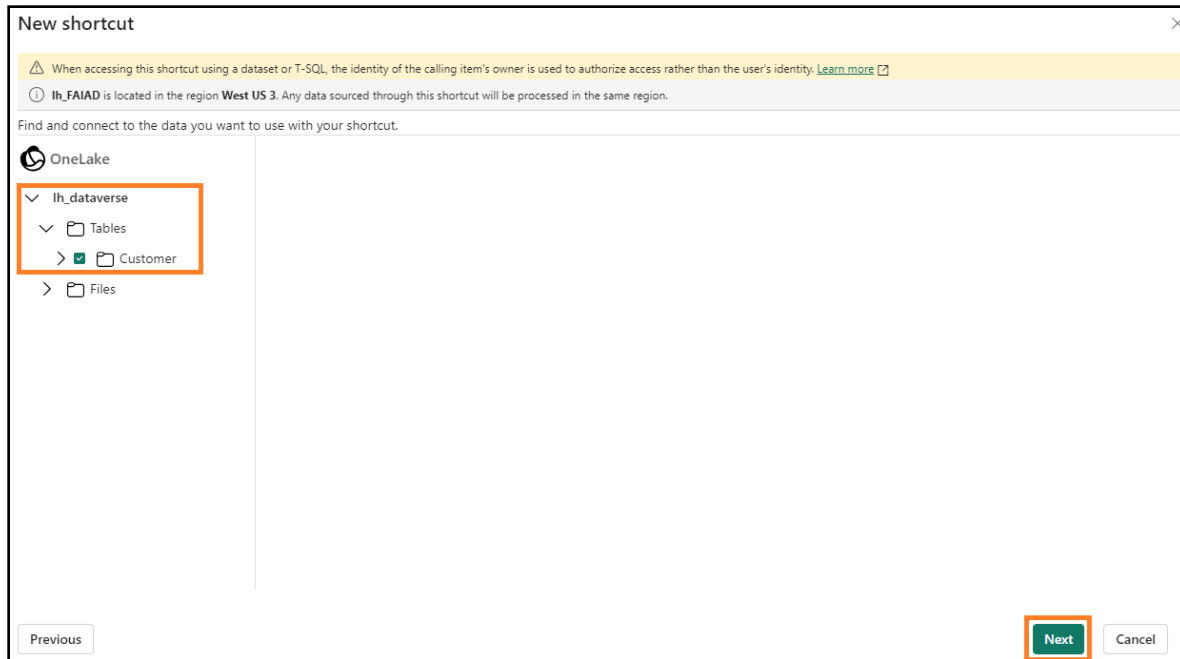

3. New shortcut dialog opens. Select **Microsoft OneLake** option under Internal sources.

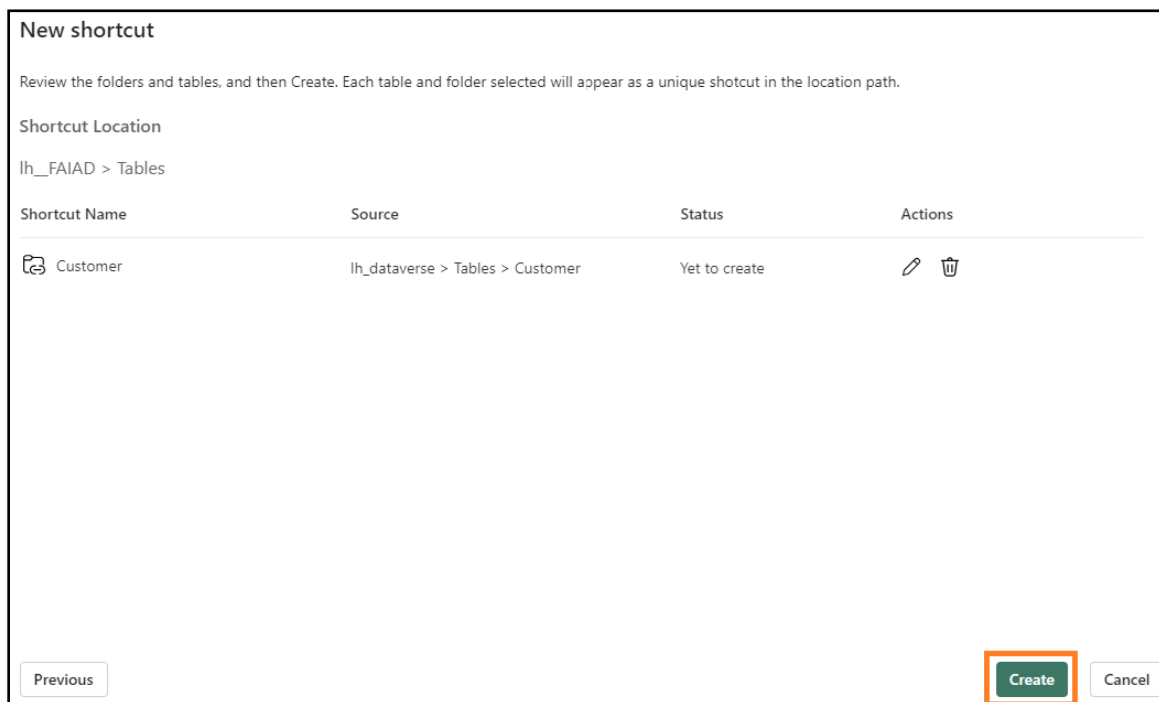

4. Select a data source type dialog opens. Notice you have two data sources.
 - a. lh_FAIAID – this is the Lakehouse you have created.
 - b. lh_dataverse – this is the Lakehouse admin has created.
5. Select **lh_dataverse**.
6. Select **Next**.

7. In the left panel, expand **lh_dataverse** -> **Tables**. Notice the IT admin has provided access to Customer table.
8. Select **Customer**.
9. Select **Next**.

10. Select **Create** on the next dialog. You will be navigated back to lh_FAIID lakehouse.

11. In the **Explorer** panel on the left, notice the new **Customer** table has been created.

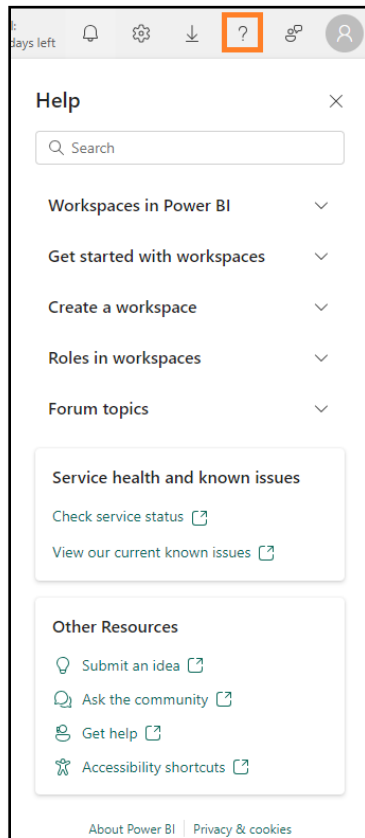

12. Select **Customer** table to view the data in the preview panel.

We have successfully created a shortcut to another Lakehouse.

In the next lab, we will set up schedule refreshes.

References

Fabric Analyst in a Day (FAIAD) introduces you to some of the key functions available in Microsoft Fabric. In the menu of the service, the Help (?) section has links to some great resources.

Here are a few more resources that will help you with your next steps with Microsoft Fabric.
